

Chapter 13: I/O Systems

- I/O Hardware
- Application I/O Interface
- Kernel I/O Subsystem
- Transforming I/O Requests to Hardware Operations
- Streams
- Performance

I/O Hardware

- Incredible variety of I/O devices
- Common concepts
 - ♦ Port
 - ♦ Bus (daisy chain or shared direct access)
 - ♦ Controller (host adapter)
- I/O instructions control devices
- Devices have addresses, used by
 - ♦ Direct I/O instructions
 - ♦ Memory-mapped I/O

A Typical PC Bus Structure

Device I/O Port Locations on PCs (partial)

I/O address range (hexadecimal)	device
000-00F	DMA controller
020-021	interrupt controller
040-043	timer
200-20F	game controller
2F8-2FF	serial port (secondary)
320-32F	hard-disk controller
378-37F	parallel port
3D0-3DF	graphics controller
3F0-3F7	diskette-drive controller
3F8-3FF	serial port (primary)

Example

- cat /proc/ioprots
- 0000-001f : dma1
- 0020-003f : pic1
- 0040-005f : timer
- 0060-006f : keyboard
- 0070-007f : rtc
- 0080-008f : dma page reg
- 00a0-00bf : pic2
- 00c0-00df : dma2
- 00f0-00ff : fpu
- 0170-0177 : ide1
- 02f8-02ff : serial(auto)
- 0376-0376 : ide1
- 03c0-03df : vga+
- 03f8-03ff : serial(auto)

Example, continued

- 0cf8-0cff : PCI conf1
- ccd0-ccdf : Intel Corporation 82801AA SMBus
- d000-efff : PCI Bus #02
- dc80-dcff : 3Com Corporation 3c905C-TX [Fast Etherlink]
- dc80-dcff : eth0
- e000-efff : PCI Bus #03
- e800-e8ff : Adaptec 7899P (#2)
- e800-e8fe : aic7xxx
- ec00-ecff : Adaptec 7899P
- ec00-ecfe : aic7xxx
- ff80-ff9f : Intel Corporation 82801AA USB
- ff80-ff9f : usb-uhci
- ffa0-ffaf : Intel Corporation 82801AA IDE
- ffa8-ffaf : ide1

I/O Space vs. Memory Space

- I/O space is accessed with I/O instructions:
 - `outb %al,$18`
- Memory space is accessed with memory instructions:
 - `movl $0, (%edx)`
 - `movl $3, %eax`

Operating System Concepts 13.7 Silberschatz, Galvin and Gagne ©2002

Polling

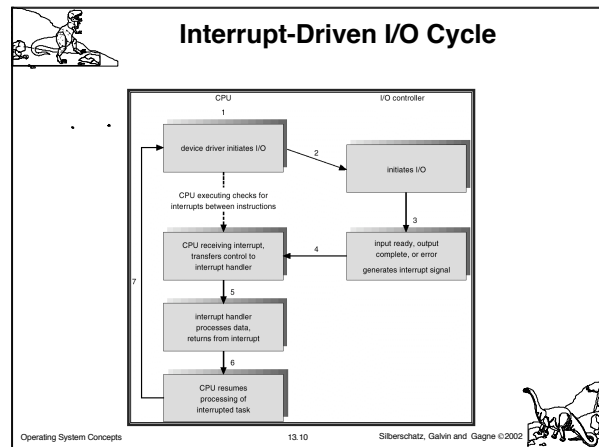

- Determines state of device
 - ♦ `command-ready`
 - ♦ `busy`
 - ♦ `Error`
- Busy-wait cycle to wait for I/O from device

Operating System Concepts 13.8 Silberschatz, Galvin and Gagne ©2002

Interrupts

- CPU Interrupt request line triggered by I/O device
- Interrupt handler receives interrupts
- Maskable to ignore or delay some interrupts
- Interrupt vector to dispatch interrupt to correct handler
 - ♦ Based on priority
 - ♦ Some unmaskable
- Interrupt mechanism also used for exceptions

Operating System Concepts 13.9 Silberschatz, Galvin and Gagne ©2002

Intel Pentium Processor Event-Vector Table

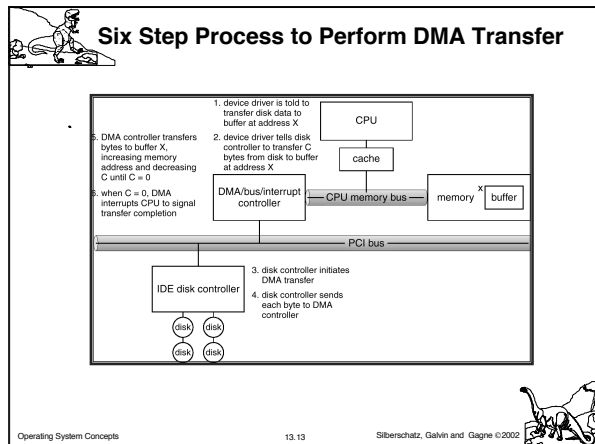

vector number	description
0	divide error
1	debug exception
2	null interrupt breakpoint
3	INTO-detected overflow
4	bound range exception
5	invalid opcode
6	device not available
7	double fault
8	coprocessor segment overrun (reserved)
9	invalid task state segment
10	segment not present
11	stack fault
12	general protection
13	page fault
14	(Intel reserved, do not use)
15	floating-point error
16	alignment check
17	machine check
18	(Intel reserved, do not use)
19-31	maskable interrupts

Operating System Concepts 13.11 Silberschatz, Galvin and Gagne ©2002

Direct Memory Access

- Used to avoid programmed I/O for large data movement
- Requires DMA controller
- Bypasses CPU to transfer data directly between I/O device and memory

Operating System Concepts 13.12 Silberschatz, Galvin and Gagne ©2002

Why is DMA faster?

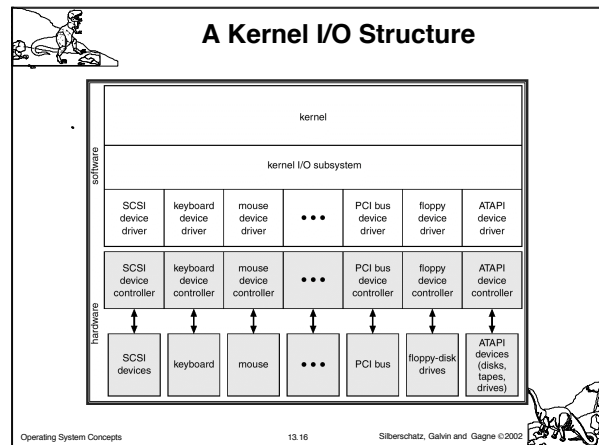

- Claim: DMA will be able to move data at least twice as fast (and probably three times as fast) as using the CPU
- Why?

Operating System Concepts 13.14 Silberschatz, Galvin and Gagne ©2002

Application I/O Interface

- I/O system calls encapsulate device behaviors in generic .classes
- Device-driver layer hides differences among I/O controllers from kernel
- Devices vary in many dimensions
 - ✦ Character-stream or block
 - ✦ Sequential or random-access
 - ✦ Sharable or dedicated
 - ✦ Speed of operation
 - ✦ read-write, read only, or write only

Operating System Concepts 13.15 Silberschatz, Galvin and Gagne ©2002

Characteristics of I/O Devices

aspect	variation	example
data-transfer mode	character block	terminal disk
access method	sequential random	modern CD-ROM
transfer schedule	synchronous asynchronous	tape keyboard
sharing	dedicated sharable	tape keyboard
device speed	latency seek time transfer rate delay between operations	
I/O direction	read only write only readWrite	CD-ROM graphics controller disk

Operating System Concepts 13.17 Silberschatz, Galvin and Gagne ©2002

Block and Character Devices

- Block devices include disk drives
 - ✦ Commands include read, write, seek
 - ✦ Raw I/O or file-system access
 - ✦ Memory-mapped file access possible
- Character devices include keyboards, mice, serial ports
 - ✦ Commands include get, put
 - ✦ Libraries layered on top allow line editing

Operating System Concepts 13.18 Silberschatz, Galvin and Gagne ©2002

Network Devices

- Varying enough from block and character to have own interface
- Unix and Windows NT/9/2000 include socket interface
 - ✦ Separates network protocol from network operation
 - ✦ Includes `select` functionality
- Approaches vary widely (pipes, FIFOs, streams, queues, mailboxes)

Operating System Concepts 13.19 Silberschatz, Galvin and Gagne ©2002

Clocks and Timers

- Provide current time, elapsed time, timer
- If programmable interval time used for timings, periodic interrupts
- `ioctl` (on UNIX) covers odd aspects of I/O such as clocks and timers

Operating System Concepts 13.20 Silberschatz, Galvin and Gagne ©2002

Blocking and Nonblocking I/O

- Blocking - process suspended until I/O completed
 - ✦ Easy to use and understand
 - ✦ Insufficient for some needs
- Nonblocking - I/O call returns as much as available
 - ✦ User interface, data copy (buffered I/O)
 - ✦ Implemented via multi-threading
 - ✦ Returns quickly with count of bytes read or written
- Asynchronous - process runs while I/O executes
 - ✦ Difficult to use
 - ✦ I/O subsystem signals process when I/O completed

Operating System Concepts 13.21 Silberschatz, Galvin and Gagne ©2002

Kernel I/O Subsystem

- Scheduling
 - ✦ Some I/O request ordering via per-device queue
 - ✦ Some OSs try fairness
- Buffering - store data in memory while transferring between devices
 - ✦ To cope with device speed mismatch
 - ✦ To cope with device transfer size mismatch
 - ✦ To maintain "copy semantics"

Operating System Concepts 13.22 Silberschatz, Galvin and Gagne ©2002

Sun Enterprise 6000 Device-Transfer Rates

Device	Transfer Rate (approx.)
gigaplane bus	> 1,000,000
SBUS	~500,000
SCSI bus	~100,000
fast ethernet	~10,000
hard disk	~1,000
ethernet	~100
laser printer	~10
modem	~1
mouse	~0.1
keyboard	~0.01

Operating System Concepts 13.23 Silberschatz, Galvin and Gagne ©2002

Kernel I/O Subsystem

- Caching - fast memory holding copy of data
 - ✦ Always just a copy
 - ✦ Key to performance
- Spooling - hold output for a device
 - ✦ If device can serve only one request at a time
 - ✦ i.e., Printing
- Device reservation - provides exclusive access to a device
 - ✦ System calls for allocation and deallocation
 - ✦ Watch out for deadlock

Operating System Concepts 13.24 Silberschatz, Galvin and Gagne ©2002

Error Handling

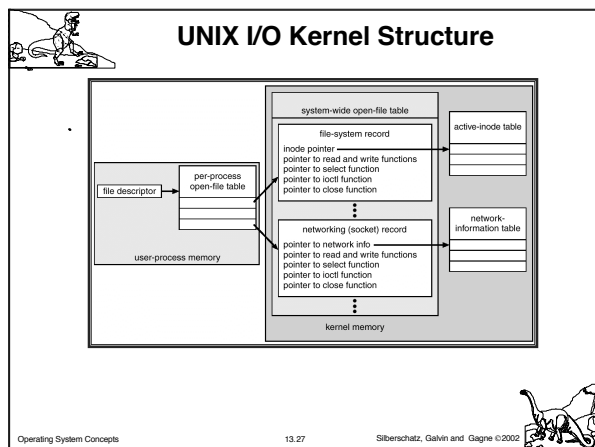

- OS can recover from disk read, device unavailable, transient write failures
- Most return an error number or code when I/O request fails
- System error logs hold problem reports

Operating System Concepts 13.25 Silberschatz, Galvin and Gagne ©2002

Kernel Data Structures

- Kernel keeps state info for I/O components, including open file tables, network connections, character device state
- Many, many complex data structures to track buffers, memory allocation, "dirty" blocks
- Some use object-oriented methods and message passing to implement I/O

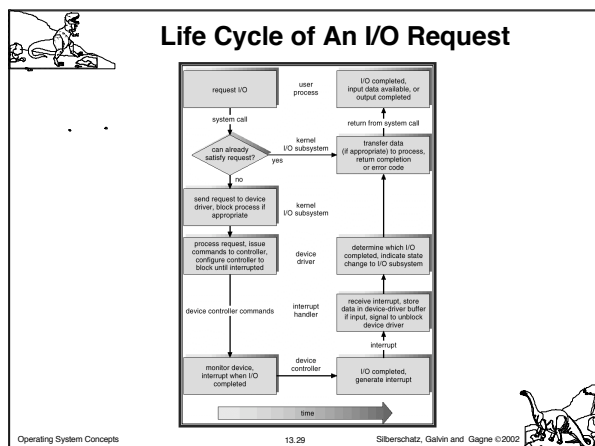

Operating System Concepts 13.26 Silberschatz, Galvin and Gagne ©2002

I/O Requests to Hardware Operations

- Consider reading a file from disk for a process:
 - ◆ Determine device holding file
 - ◆ Translate name to device representation
 - ◆ Physically read data from disk into buffer
 - ◆ Make data available to requesting process
 - ◆ Return control to process

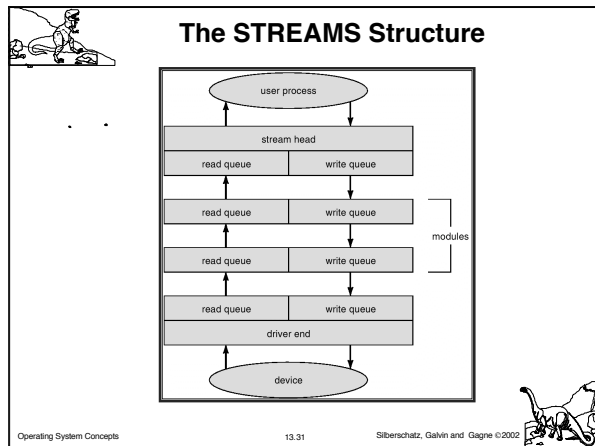

Operating System Concepts 13.28 Silberschatz, Galvin and Gagne ©2002

STREAMS

- **STREAM** – a full-duplex communication channel between a user-level process and a device
- A **STREAM** consists of:
 - **STREAM head** interfaces with the user process
 - **driver end** interfaces with the device
 - zero or more **STREAM modules** between them.
- Each module contains a **read queue** and a **write queue**
- Message passing is used to communicate between queues

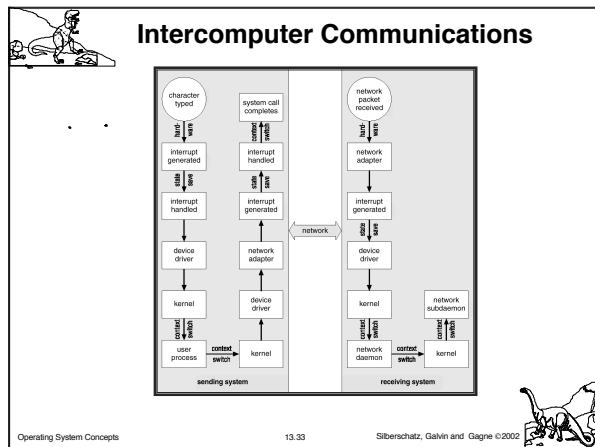

Operating System Concepts 13.30 Silberschatz, Galvin and Gagne ©2002

Performance

- I/O a major factor in system performance:
 - ✦ Demands CPU to execute device driver, kernel I/O code
 - ✦ Context switches due to interrupts
 - ✦ Data copying
 - ✦ Network traffic especially stressful

Operating System Concepts 13.32 Silberschatz, Galvin and Gagne ©2002

Improving Performance

- Reduce number of context switches
- Reduce data copying
- Reduce interrupts by using large transfers, smart controllers, polling
- Use DMA
- Balance CPU, memory, bus, and I/O performance for highest throughput

Operating System Concepts 13.34 Silberschatz, Galvin and Gagne ©2002
